VITAMIN TRIALS
{ THE CHALLENGE }

You are a Data Scientist working for a health research lab.

Recently there was a vitamin trial that ran for several weeks: a new vitamin was prescribed to people of different ages and genders in different dosages. At the end of the trial they were all given the same control exam to test their cognitive ability.

You have been tasked to analyse the results of the trial and visualise them in the form of a scatterplot. Any and all trends you find must be made easily visible on the scatterplot without the aid of markup tools and annotations.
